How to Run the ILO Application

This application was created using Android Studio. To run it, first download the Android Studio IDE from https://developer.android.com/studio/index.html and run the installation wizard using default settings.

If you have not yet cloned the repository to your computer, please read the Git-Instructions.txt
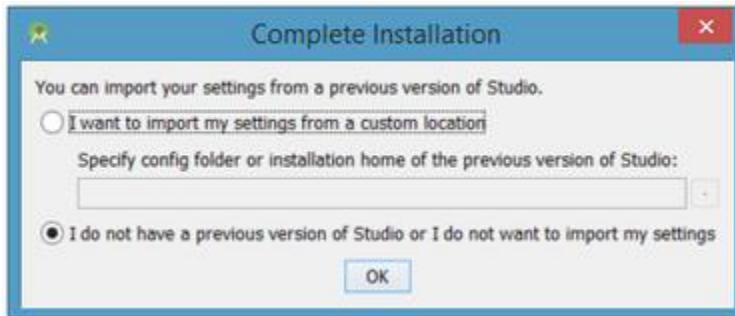

Just keep clicking next and "I agree" through the various screens. Again default settings will do. This process will take you through multiple screens
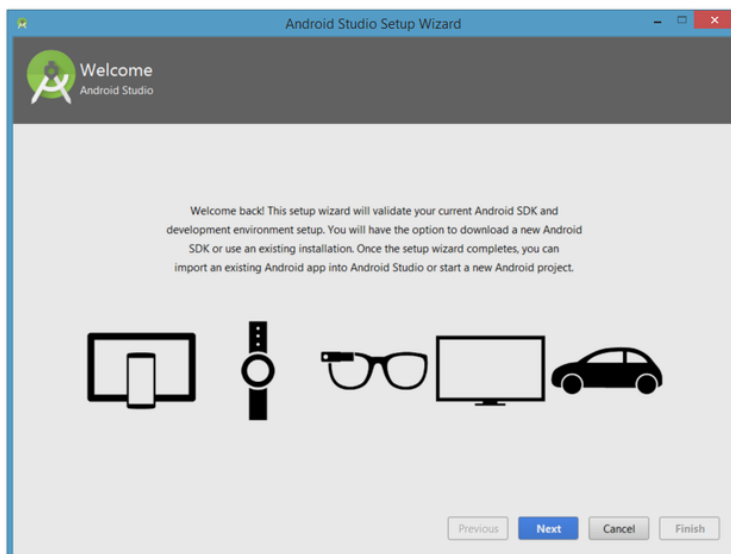

Once you have finished installing, make sure "Start Android Studio" is checked and click "Finish".

This opening screen should pop up. No interaction is needed.

If you have not used android studio before, select the "I do not have…" option.
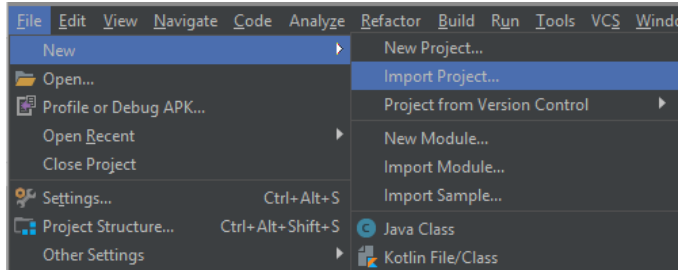

Click "Next"

Click "Standard" unless you already know android studio well.

Click "Finish" and wait for the program to finish downloading components

This screen will only appear if this is the first time you are running android studio. Click "Import Project" and navigate to the "Functions" folder of your repository and click "Open"

If the previous screen did not show up for you, open Android Studio, go to the upper left corner, and click File -> New -> Import Project and navigate to Functions folder in your local repository.

This should automatically set up the application in the IDE and allow you to run it.
